

Textile Industry Business Management Software

TEXpro from One Systems

TEXpro is our accounting, distribution and manufacturing solution for the 'fibre to fabric' sectors. It has been written specifically to meet the requirements of merchants, fibre and yarn processors, spinners, weavers, knitters, dyers and finishers. A further optional module, Colours, extends the functionality of TEXpro through to the finished garment.

TEXpro is based around a series of **core modules** that together provide comprehensive functionality for sales order processing, purchasing, stock control, production planning, works order processing, work in progress tracking, costing and financial accounting. **Optional sub-modules** provide specific functionality to meet the particular needs of individual textiles sectors, including CMT, commission dyeing and finishing, jacquard weaving, lace knitting, fabric printing and more.

No two textiles businesses are alike, and this is reflected in our software. The many benefits of a standard package are combined with a **high level of flexibility**, such that product codes, documents, screen layouts, labels and reports can meet your precise requirements without changes to the underlying software. TEXpro can be moulded to fit your business, not vice versa.

TEXpro is intuitive and very **easy to use**. All screens share the same presentation and use the same keys to carry out the same functions. Wherever possible a single screen is used to add, amend, delete and enquire on data so there are fewer screens to learn.

TEXpro runs under many different **operating systems**, including Windows Servers and most flavours of UNIX. A low cost migration path between operating systems offers valuable investment protection. TEXpro can run on almost any end user hardware from the latest specification PCs through to old 486s and dumb terminals, allowing existing hardware to be retained and reducing project costs. TEXpro is fully e-commerce enabled.

Why should you buy TEXpro?

TEXpro is very 'open'. We have interfaces to most machine monitoring systems, including Barco, Datacolor, Beacon, LoomData, Stork, Trumeter and others. As well as extensive analysis functions and a strong suite of standard reports, industry-standard ODBC compliance allows you to access your data using most Windows-based 'off-the-shelf' reporting tools. Data can also be exported to other packages for further analysis, including our new Analyst Financials reporting module.

The **financial accounting** modules within TEXpro are from the well-established and widely used Global 3000 accounting suite. Global 3000 is a leading mid-market accounting package in its own right, with around 1,500 users based mainly in the UK.

TEXpro is closely integrated with the **Preactor** family of production scheduling solutions. Preactor is an ideal production scheduling tool for textiles companies because it allows vertically integrated manufacturing environments to be modelled, including the interdependencies between process stages such as beaming, weaving, dyeing and finishing and packing. Operations of fixed duration (e.g dyeing) can be included alongside operations based on process time per unit, and essential standing time within processes for conditioning, drying and so on can be automatically enforced within the schedule.

Why should you buy from One Systems?

We are in the unique position to give you advice and support on one of the best and most versatile software applications for the textile industry. Our track record speaks for itself.
